Growth and Development Observation Summary

In the space below, take a moment to summarize your observations about growth and development for at least one of the organisms you studied in class. Draw upon your observation notes and create some kind of timeline that tracks the stages of growth and change in your organism. Use quick sketches to illustrate and connect stages with arrows, adding enough text to make a coherent story of what you observed.

Now compile your questions. You may briefly re-list some of the questions you generate on your observation notes here. Also add any new question you may have. (Maybe you have additional questions after creating the summary above.) Spill onto the back of this sheet as necessary.
